

The tiger mosquito can only be defeated together.

The Municipality of Carpi is providing a free sample of larvicide to all households to treat stagnant water that cannot be removed. This initiative is vital for preventing and containing the spread of the tiger mosquito within our community.

For effective prevention, please follow these guidelines:

- Apply Treatments: From April to October, use the provided larvicide or similar products available at pharmacies and specialized stores. Always follow the instructions on the technical data sheet.
- Rainfall Protocol: Repeat the treatment within 5 days in the event of heavy rain.
- Maintenance: Keep a record of your treatments using the log provided.
- Elimination of Stagnant Water: Remove water from containers such as saucers, drains, buckets, and watering cans, as these are primary breeding grounds.

The Municipality of Carpi regularly performs larvicide treatments in public areas, treating approximately 16,000 drains; However, 70% of them are located on private land.

Larvicide kit distribution points will also be activated within the municipal area.
